

UNIVERSITY CLUB EVENT MANAGEMENT SYSTEM

PROJECT REPORT

Submitted for Academic Requirement

Technology: PHP, MySQL, HTML, CSS, JavaScript

Year: 2026

1. Introduction

The University Club Event Management System is a web-based application designed to manage university club activities and events efficiently using PHP and MySQL.

2. Objectives

To digitalize event management, enable registration, manage clubs, and provide secure participation tracking.

3. Features

Member registration, login, event browsing, admin event creation, approval system, dashboards, and reporting.

4. Technology Stack

Frontend: HTML, CSS, JavaScript. Backend: PHP. Database: MySQL.

5. Security Features

Password hashing, CSRF protection, session regeneration, and secure file uploads.

6. System Architecture

Client-server architecture where PHP handles logic and MySQL manages data storage.

7. Database Setup

Database name: university_club_events with schema import and configured credentials.

8. Advantages

Easy management, centralized system, secure authentication, and efficient tracking.

9. Limitations

Requires local server setup and has basic UI design.

10. Future Improvements

Mobile app, notifications, analytics dashboard, and role-based access.

11. Conclusion

The system provides an efficient platform for managing university club events with improved communication and organization.
